

Travel Billing Software - UI & UX Plan (PyQt6 + SQLite)

Main Pages

The software should look clean, modern, and slightly premium to make the client feel it's professional, even though it's simple inside.

Main navigation pages: 1. **Dashboard** – Overview, analytics, KPIs 2. **Billing** – Create and edit transactions 3. **Reports** – View and export past transactions 4. **Settings** – App preferences and supplier management 5. **About** – App info and credits

Navigation placed in a **left sidebar**, each item with an icon.

Sidebar (Navigation)	Main Page Content
 Dashboard  Billing  Reports Settings About	

Dashboard Page

Purpose: Give a professional summary view of business performance.

Layout:

Header: Travel Billing	
Date: [Auto Today's Date]	
[Total Sales] [Total Profit] [Pending Balance] [Tickets Sold]	
[Top Supplier] [Top Customer]	
[Profit by Day - Bar Chart]	[Supplier Share - Pie Chart]
Quick Actions: [New Bill] [ View Reports]	

Visual Components: - KPI Cards (Rounded boxes with bold fonts) - Charts: Matplotlib Bar + Pie chart embedded in PyQt - Use gradient colors or slight shadows for modern look.

Billing Page

Goal: Simple, professional transaction entry — not confusing for user.

Instead of raw fields like *cash*, *bank*, *balance*, we reframe it clearly.

Layout:

```
| Section: Customer Details
| Name: [_____] Contact: [_____]
| Ticket No: [_____] Sector: [_____]
| Item Type: [Visa | Ticket | Other]
| Supplier: [Dropdown: Supplier 1 | Supplier 2 | Supplier 3]
|
| Section: Payment Details
| Total Amount: [_____]
| Payment Method: [Cash | Bank | Split]
|   If Split → Show: Cash [___] + Bank [___]
| Amount Received: [Auto from method]
| Balance Due: [Auto calculate: Total - Received]
| Profit: [Auto Calculate or Input]
|
| Buttons: [ Save Bill] [ Print Bill] [ Clear]
```

Professional Touches: - Auto-fill profit based on previous supplier rates. - Auto date entry. - Simple form validation (show red border if empty field). - Animated success message: " Bill Saved Successfully".

Reports Page

```
| Filters: From [___] To [___] Supplier [Dropdown] Customer [Dropdown]
| [Filter] [ Export Excel] [ Export PDF]
```

```
| Table of Transactions
```

```
| SI | Name | Ticket | Supplier | Amount | Profit | Balance |
```

Features: - Sortable columns - Double-click row → Open billing form pre-filled - Export button → Excel / PDF with company logo

Settings Page

Purpose: Business preferences & supplier configuration.

Sections: - Business Info (Name, Logo, Address) - Supplier Management (Add/Edit/Delete suppliers) - Default currency (₹ / \$) - Backup & Restore Data (SQLite file)

Layout Example:

```
| Company Info: [Name] [Address] [Logo Upload] |
| Supplier List: [Table] + [ Add Supplier] [ Delete] |
| Default Currency: [Dropdown] |
| Backup Database: [ Export] [ Import] |
```

About Page

Small but adds polish and credibility.

```
| App Name: Travel Billing |
| Version: v1.0.0 |
| Developed by: [Your Name / Company] |
| Contact: support@yourcompany.com |
| Description: Simplified billing software for small travel agents. |
```

Include your logo or company watermark subtly.

Design Philosophy

- **Minimal UI** but **maximum clarity**.
- Use **consistent spacing, rounded edges, shadows** for premium feel.
- Every page should give a feeling of a real ERP system — even though lightweight.
- All texts should be easy to read, 16–18px font.
- Keep transitions smooth with `QStackedWidget`.

Future Add-ons

- Dark / Light mode toggle (in Settings)
- Multi-user access (later)
- Auto-backup schedule
- Graph comparison: Supplier profit trend

This UI plan gives a **complete, professional structure** with a smooth user experience — keeping it simple for the client but elegant enough to showcase your development skills.
